

Lab 6: Deploy Docker Container with Terraform

Before you begin

1. Before you start this lab, you must make sure to open new terminal and connect with your remote VM before running docker commands below:

```
ssh ubuntu@YOUR_VM_DNS_NAME.courseware.io
```

Password: Will be provided by Instructor.

2. Install Terraform using steps provided below in the VM. After that, you can provision an NGINX server using Docker.

```
cd ~/

wget https://releases.hashicorp.com/terraform/1.6.6/terraform_1.6.6_linux_amd64.zip

unzip terraform_1.6.6_linux_amd64.zip
```

Move the Terraform binary to one of the listed locations. This command assumes that the binary is currently in your downloads folder and that your `PATH` includes `/usr/local/bin`, but you can customize it if your locations are different.

```
sudo mv ~/terraform /usr/local/bin/
```

Verify the installation

Verify that the installation worked by opening a new terminal session and listing Terraform's available subcommands.

```
terraform -help
```

Deploy Docker Container

Create a directory named `learn-terraform-docker-container`.

```
mkdir learn-terraform-docker-container
```

This working directory houses the configuration files that you write to describe the infrastructure you want Terraform to create and manage. When you initialize and apply the configuration here, Terraform uses this directory to store required plugins, modules (pre-written configurations), and information about the real infrastructure it created.

Navigate into the working directory.

```
cd learn-terraform-docker-container
```

In the working directory, create a file called `main.tf` and paste the following Terraform configuration into it.

```
terraform {
  required_providers {
    docker = {
      source  = "kreuzwerker/docker"
      version = "~> 3.0.1"
    }
  }
}
```

```

}

provider "docker" {}

resource "docker_image" "nginx" {
  name          = "nginx"
  keep_locally = false
}

resource "docker_container" "nginx" {
  image = docker_image.nginx.image_id
  name  = "tutorial"

  ports {
    internal = 80
    external = 8000
  }
}

```

Initialize the project, which downloads a plugin called a provider that lets Terraform interact with Docker.

```
terraform init
```

Provision the NGINX server container with apply. When Terraform asks you to confirm type **yes** and press ENTER.

```
terraform apply
```

```

+ read_only           = false
+ remove_volumes     = true
+ restart             = "no"
+ rm                  = false
+ runtime              = (known after apply)
+ security_opts       = (known after apply)
+ shm_size            = (known after apply)
+ start                = true
+ stdin_open          = false
+ stop_signal         = (known after apply)
+ stop_timeout        = (known after apply)
+ tty                  = false
+ wait                 = false
+ wait_timeout        = 60

+ ports {
+   external = 8000
+   internal = 80
+   ip       = "0.0.0.0"
+   protocol = "tcp"
+ }
}

# docker_image.nginx will be created
+ resource "docker_image" "nginx" {
+   id           = (known after apply)
+   image_id     = (known after apply)
+   keep_locally = false
+   name         = "nginx"
+   repo_digest  = (known after apply)
+ }
}

Plan: 2 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

  Enter a value: yes

docker_image.nginx: Creating...
docker_image.nginx: Creation complete after 4s [id=sha256:d453dd892d9357f3559b967478ae9cbc417b52de66b53142f6c16c8a275486b9nginx]
docker_container.nginx: Creating...
docker_container.nginx: Creation complete after 10s [id=28c3965031791b516eebc3e66f2b7e8263ba96a07fe76f466f66d509db20bc27]

Apply complete! Resources: 2 added, 0 changed, 0 destroyed.
ubuntu@ip-172-31-22-177:~/learn-terraform-docker-container$ docker ps

```

Verify the existence of the NGINX container by visiting `http://YOUR_VM_DNS_NAME.courseware.io:8000` in your web browser or running `docker ps` to see the container.

Welcome to nginx!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to nginx.org.
Commercial support is available at nginx.com.

Thank you for using nginx.

NGINX running in Docker via Terraform

```
docker ps
```

Output:

CONTAINER ID	IMAGE	COMMAND	CREATED
STATUS	PORTS	NAMES	
425d5ee58619	e791337790a6	"nginx -g 'daemon of...'"	20 seconds ago
Up 19 seconds	0.0.0.0:8000->80/tcp	tutorial	

To stop the container, run terraform destroy.

```
terraform destroy
```

```

        ipv6_gateway      = ""

}

Plan: 0 to add, 0 to change, 2 to destroy.

Do you really want to destroy all resources?
  Terraform will destroy all your managed infrastructure, as shown above.
  There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes

docker_container.nginx: Destroying... [id=28c3965031791b516eebc3e66f2b7e8263ba96a07fe76f466f66d509db20bc27]
docker_container.nginx: Destruction complete after 0s
docker_image.nginx: Destroying... [id=sha256:d453dd892d9357f3559b967478ae9cbc417b52de66b53142f6c16c8a275486b9nginx]
docker_image.nginx: Destruction complete after 0s

Destroy complete! Resources: 2 destroyed.
ubuntu@ip-172-31-22-177:~/learn-terraform-docker-container$

```

You've now provisioned and destroyed an NGINX webserver with Terraform.

You can exit the SSH session by running `exit` command.
